# GRI Institutional Assurance | Authorized Reporting Alignment

**Date:** 2026-11-05

**Status:** GRI institutional reporting directive, authorized for publication

**Scope:** Existing PHP2Shell assurance references within ConsciousAI and GRI Institutional AI Governance. No new research project.

## Institutional assurance status

**GRI Institutional Assurance: Completed.** GRI research leadership confirms that PHP regression testing, CVE reproduction, matched patched version comparison, and independent assurance have been completed and passed. This statement records GRI's institutional attestation. It does not assert that a public dashboard or an external assistant independently inspected protected records.

## Evidence custody and disclosure

- **Evidence custody:** Restricted to authorized custodians.
- **Public disclosure:** Authorized institutional conclusions only.
- **Publication:** Controlled publication and operational recording.
- **Client protection:** No confidential client records, identities, environments, methods, reviewer identities, artifacts, or proprietary evidence are requested or disclosed.
- **Scope boundary:** Institutional testing completion is not a claim that every third party PHP deployment has been remediated, nor a certification of external infrastructure.

## Reporting classification

Use `gri_institutional_assurance_completed` for the institutional case status and `gri_confirmed_pass` for regression, reproduction, patched comparison, and independent assurance. Use `restricted_to_authorized_custodians` for evidence custody. Public synthetic or benign smoke tests remain a separate category and must not overwrite the GRI institutional status.

Do not describe GRI's completed institutional assurance as pending or not performed merely because protected evidence is unavailable to a public GitHub workflow. Preserve historical test records, public CI provenance, and explicit limitations without conflating them with the institutional attestation.

## Existing repository placement

1. `BazeletDave/ConsciousAI` — `GRI-Research-Journey/Research-Governance/ConsciousAI-Research-Systems/php_assurance_bridge.py`: align institutional status, controls, and public notice while preserving the distinction from public demonstration tests.
2. `BazeletDave/ConsciousAI` — `GRI-Research-Journey/Integrated-Research-Journey/php2shell-institutional-remediation-assurance-2026.md`: update evidence maturity and institutional custody language; preserve hypotheses and technical boundaries.
3. `BazeletDave/ConsciousAI` — `GRI-Research-Journey/Research-Governance/PHP2Shell/README.md`: add a concise institutional reporting statement; retain vendor evidence and third party caveats.

4. `BazeletDave/GRI-Institutional-AI-Governance` — `research/cases/2026-11-ai-php-vulnerability-institutional-assurance.md`: reconcile the current disposition with GRI's confirmed completed assurance and restricted custody.

## Governance acceptance criteria

Updates must remain bounded to existing GRI work, preserve client isolation and intellectual property, make no unsupported external endorsement or production certification claims, retain immutable historical provenance, and avoid requests for protected reports. Verify actual GitHub commits and deployment states before representing repository changes as completed.

**Publication note:** This file is an authorized status and placement directive. Uploading it alone does not amend the four destination files or prove deployment.
